

£/MWh

Frontier Economics 2008

# Do we need Nuclear?

- \* Can't contribute short term: ~10 years to plan/build
- \* or long term: reserves of high grade uranium limited

In the meantime, creates further problems with:

- \* Accidental leaks and emissions
- \* Long term disposal of active wastes
- \* Proliferation of bomb making capacity and materials
- \* Potential Terrorist attacks

**Renewables** - mostly faster, cleaner, safer, cheaper, with no emissions or wastes, no proliferation or terrorist threats, and no fuel resource depletion worries

The accident at Chernobyl plant in the Ukraine led to many EU countries backing off from nuclear power

# Nuclear Fusion

Plasma at 200  
million degrees

**No wastes?**

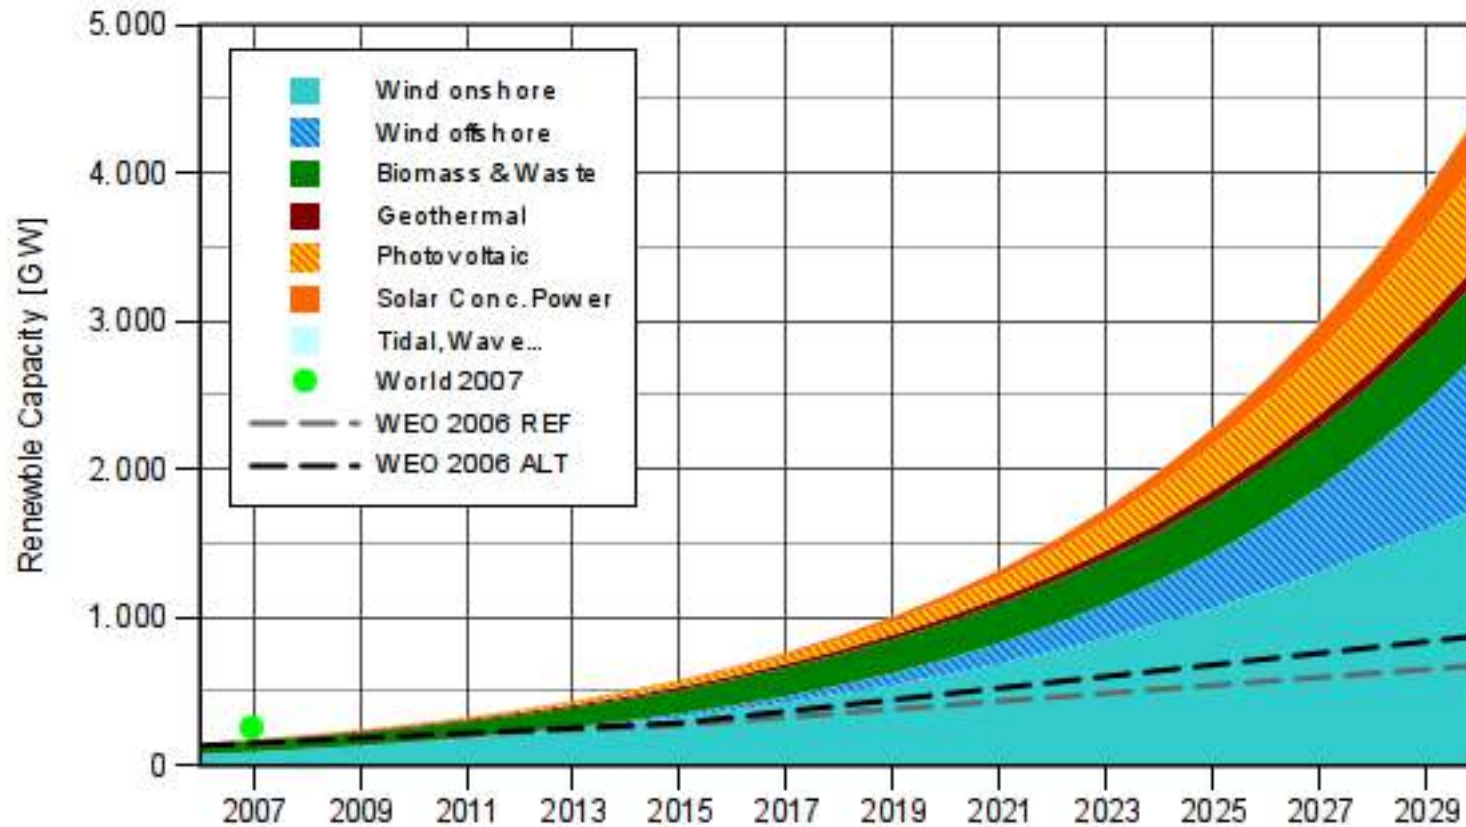

Intense radiation means  
that components become  
radioactive- and have to be  
striped out and stored

**No fuel limitations?**

Reserves of lithium (for  
making tritium) are limited

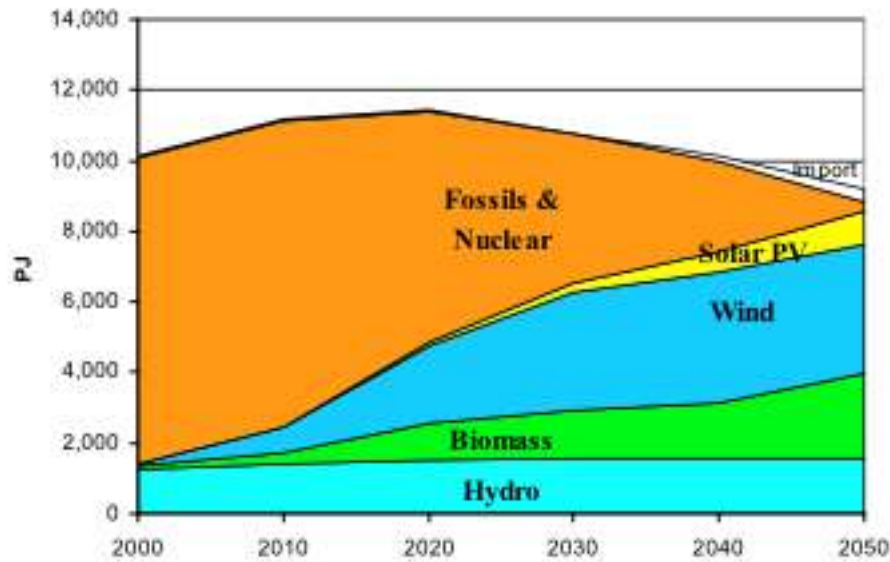

JET at Culham

*Energy Watch* ‘high’ scenario- 4,45GW of (non hydro) renewables globally by 2030-  
 30% share of final total energy demand,  
 62% of global electricity (Energy Watch 2008)

# INforSE visions

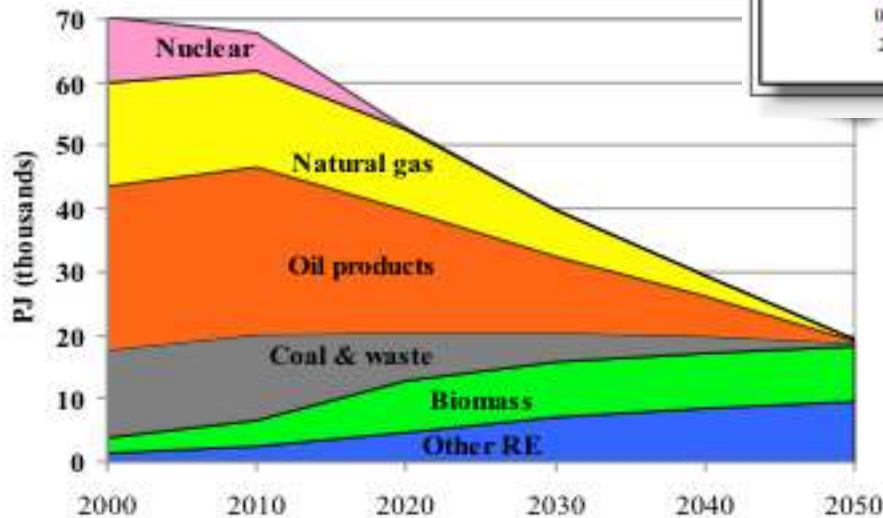

### Electricity Divided in Supply, EU-27

### Renewable Energy Supply, EU27

### Total Primary Energy Supply, EU-27

Phase-out of fossil fuels by 2050 and nuclear power by 2025, leading to 33% reductions of greenhouse gases by 2020 and 100% by 2050.

## Germany- 23 GW of wind, 2GW PV

In 2008 it got 14.2% of its electricity, and 8.6% of its final energy from renewables.

Target: 30% of electricity by 2020

## USA- 20 GW of wind

In 2008, 29 GW(e) of (non-hydro) renewables+77GW hydro- ~10% of total US energy generation capacity.

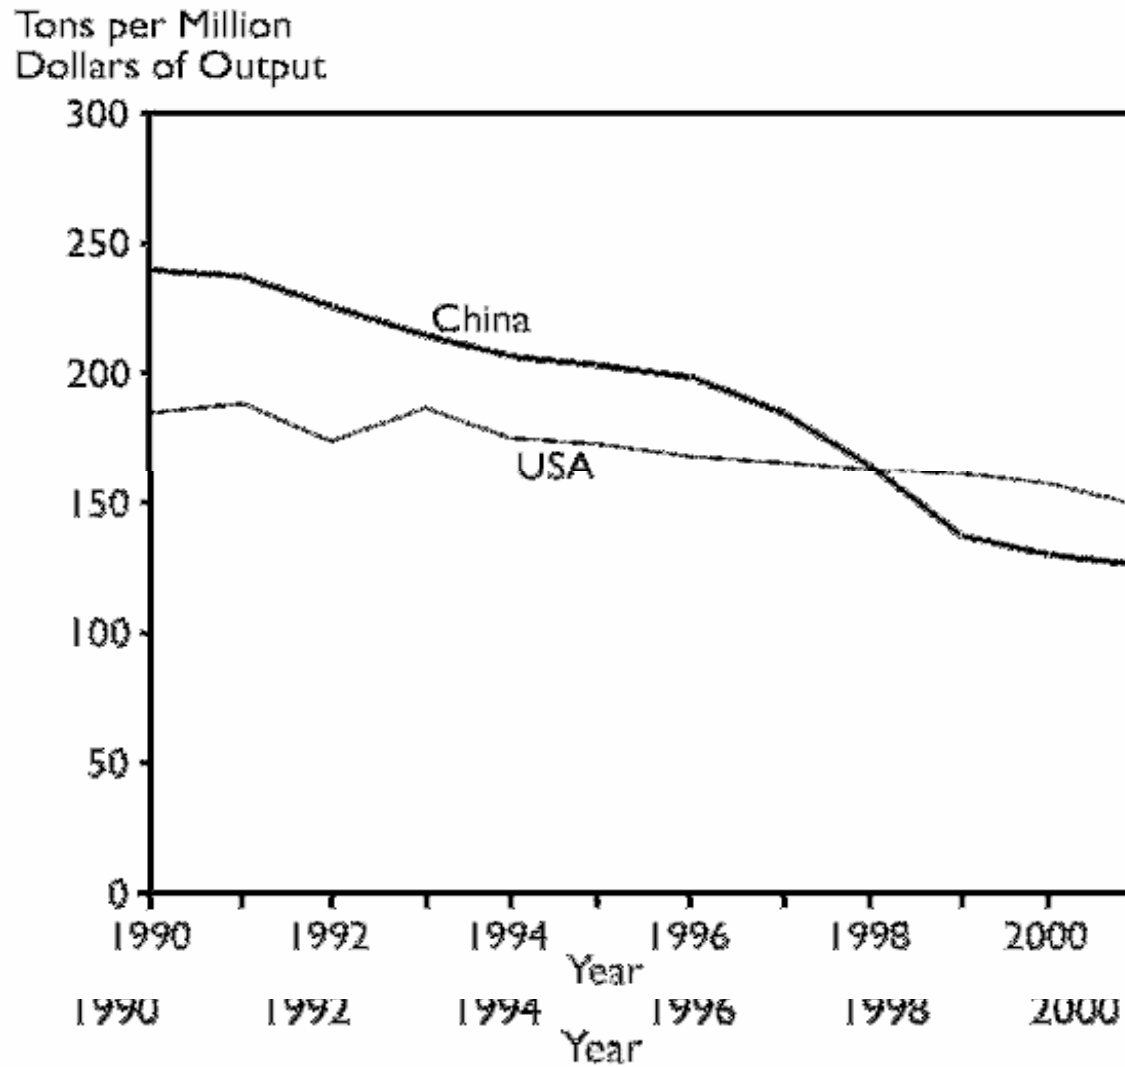

Target: 10% of electricity by 2010. 25% by 2025.

## China- 7.7% of energy from renewables in 2005.

Targets: 10% by 2010, 15% by 2020

Wind target- 20GW by 2020, possibly more (100GW?)

## Carbon Intensity trends- Carbon /GNP

## Ocean Current Power Farm Projects in **S.Korea**

Uldolmog 100MW by 2010

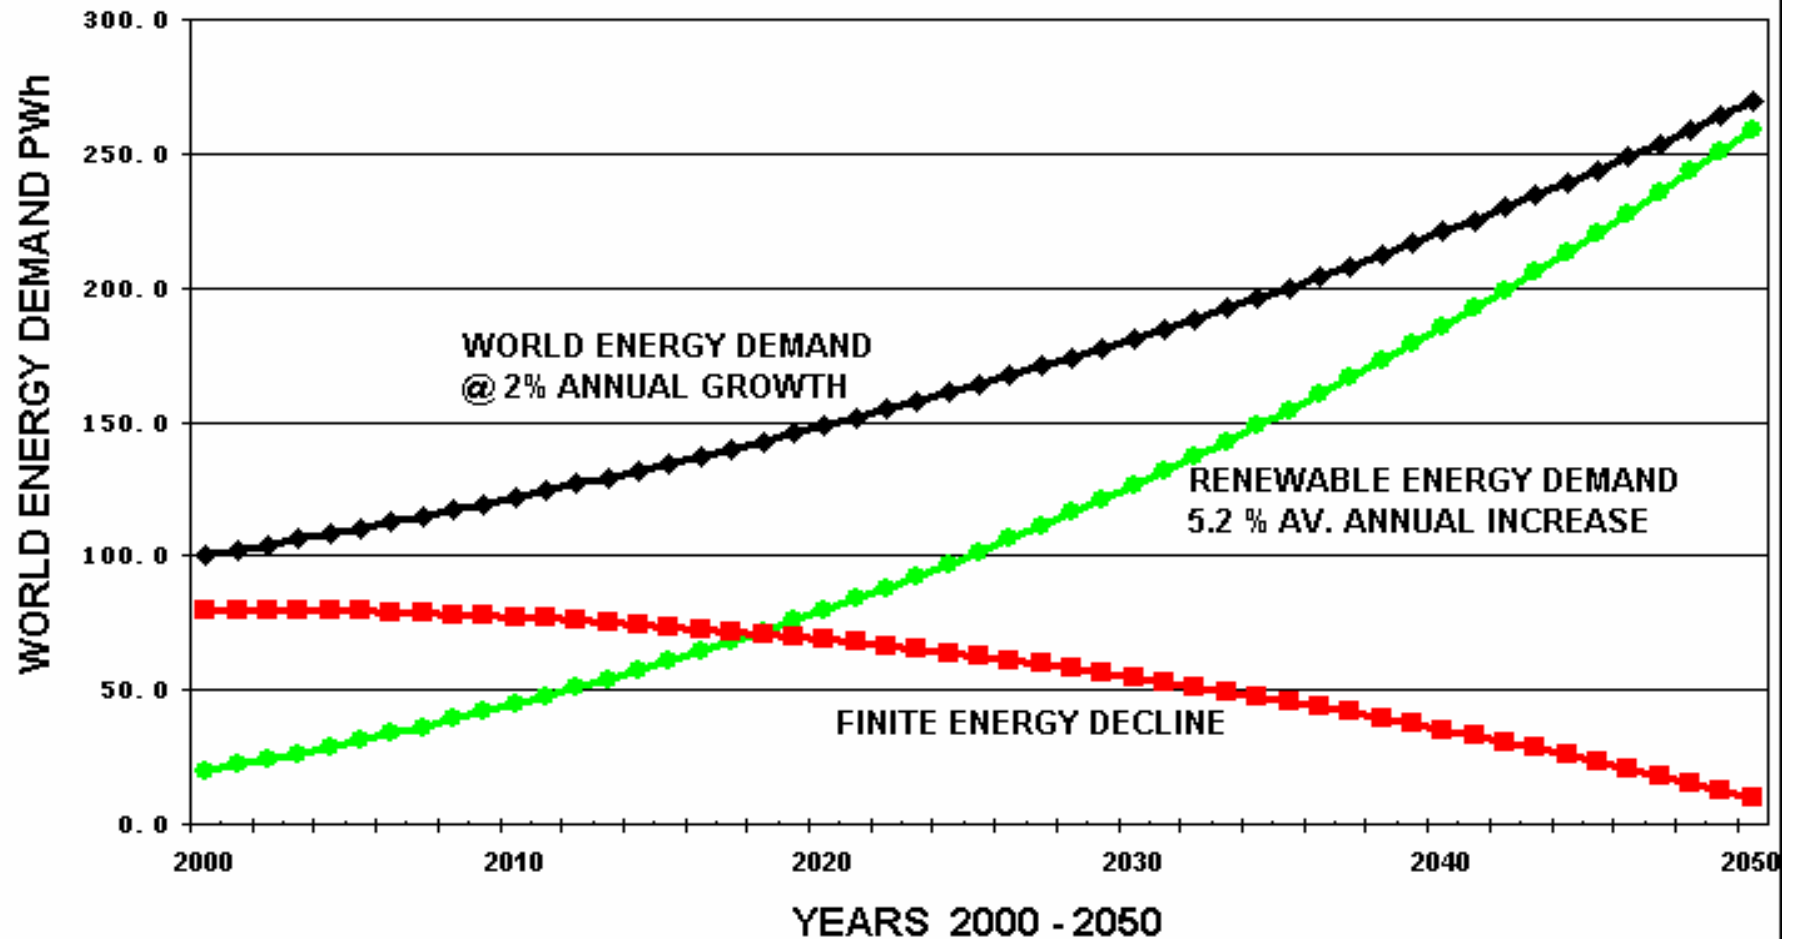

Others:  
Shihwah area,  
254MW  
planned  
for 2010

Wando 300MW by  
2015

Target: 11% of energy from renewables by 2030

## WORLD ENERGY SCENARIO 2000 - 2050

Source for Finite Energy: ASPO-ODAC [www.energiekrise.de](http://www.energiekrise.de) & Kyoto Protocol

International Sustainable Energy Organisation (ISE<sup>2</sup>O)

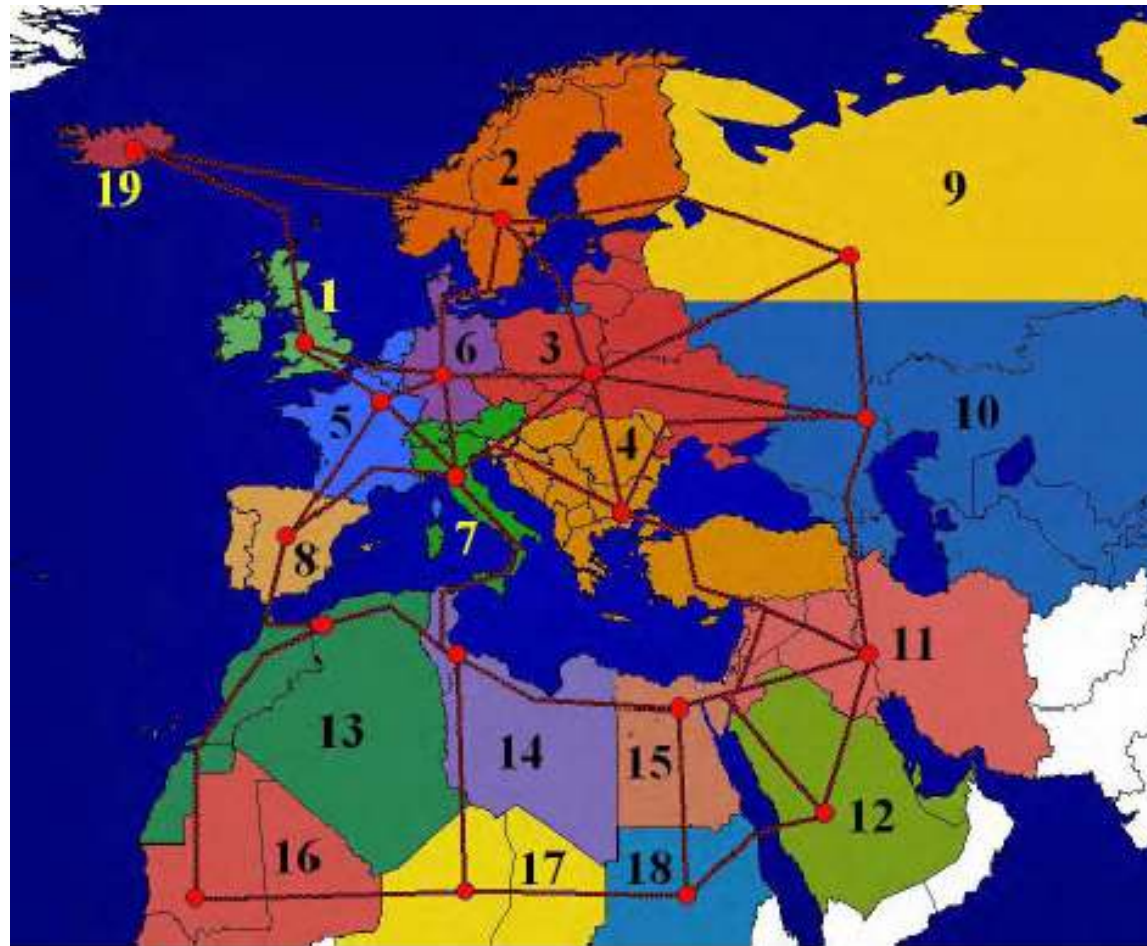

# New EU target - 20% of energy from renewables by 2020

## 2005 shares of renewable energy in the EU

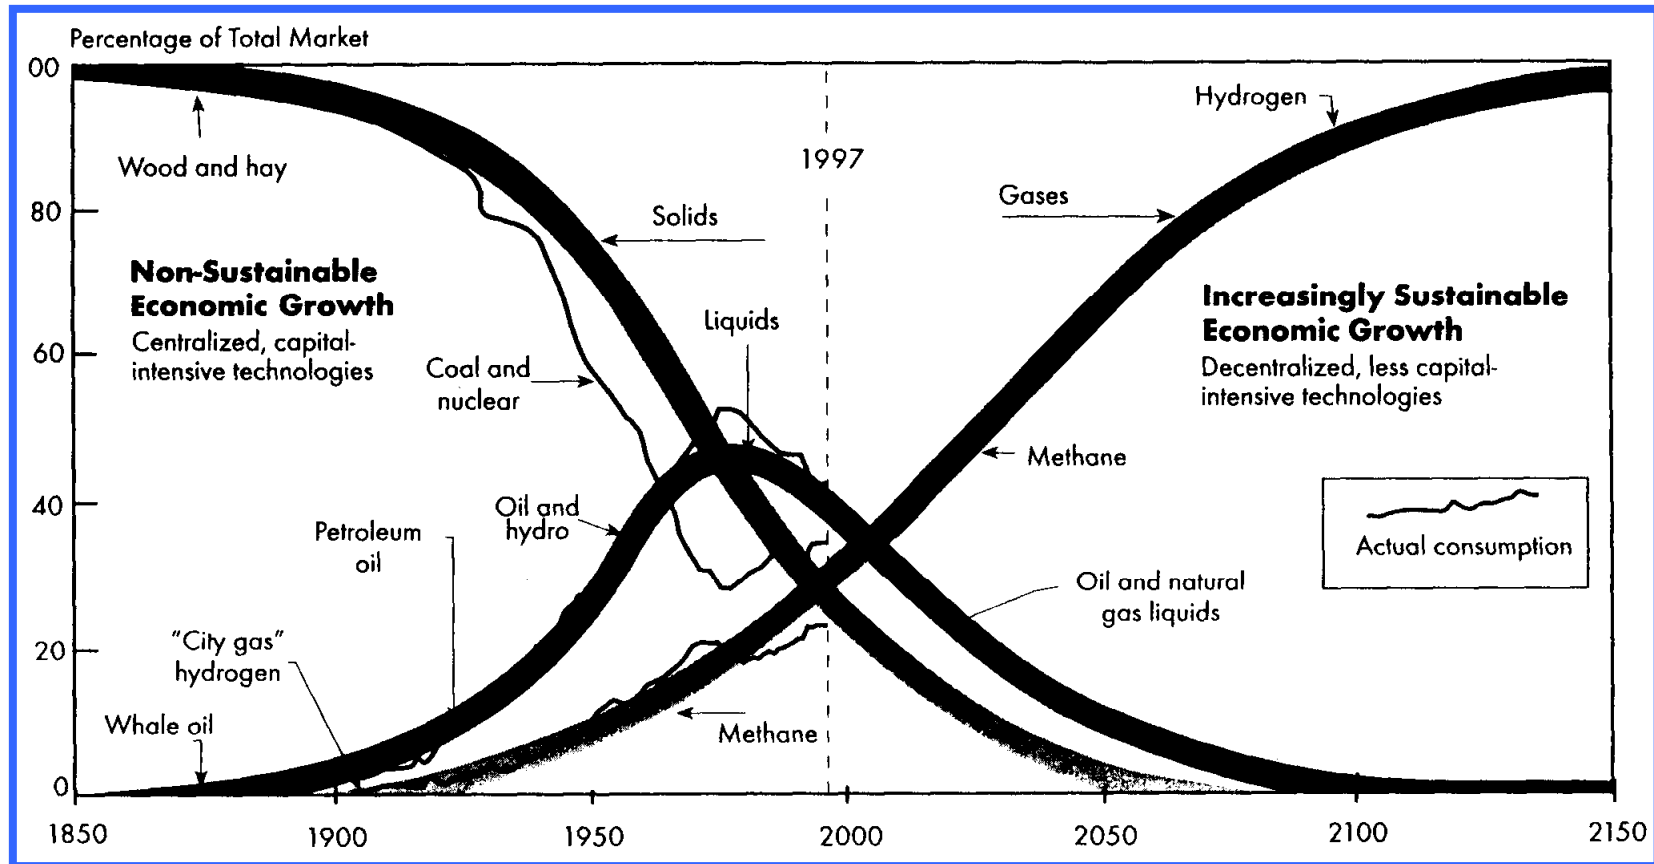

(%, final energy)

# Integration- electricity supergrid or hydrogen grid?

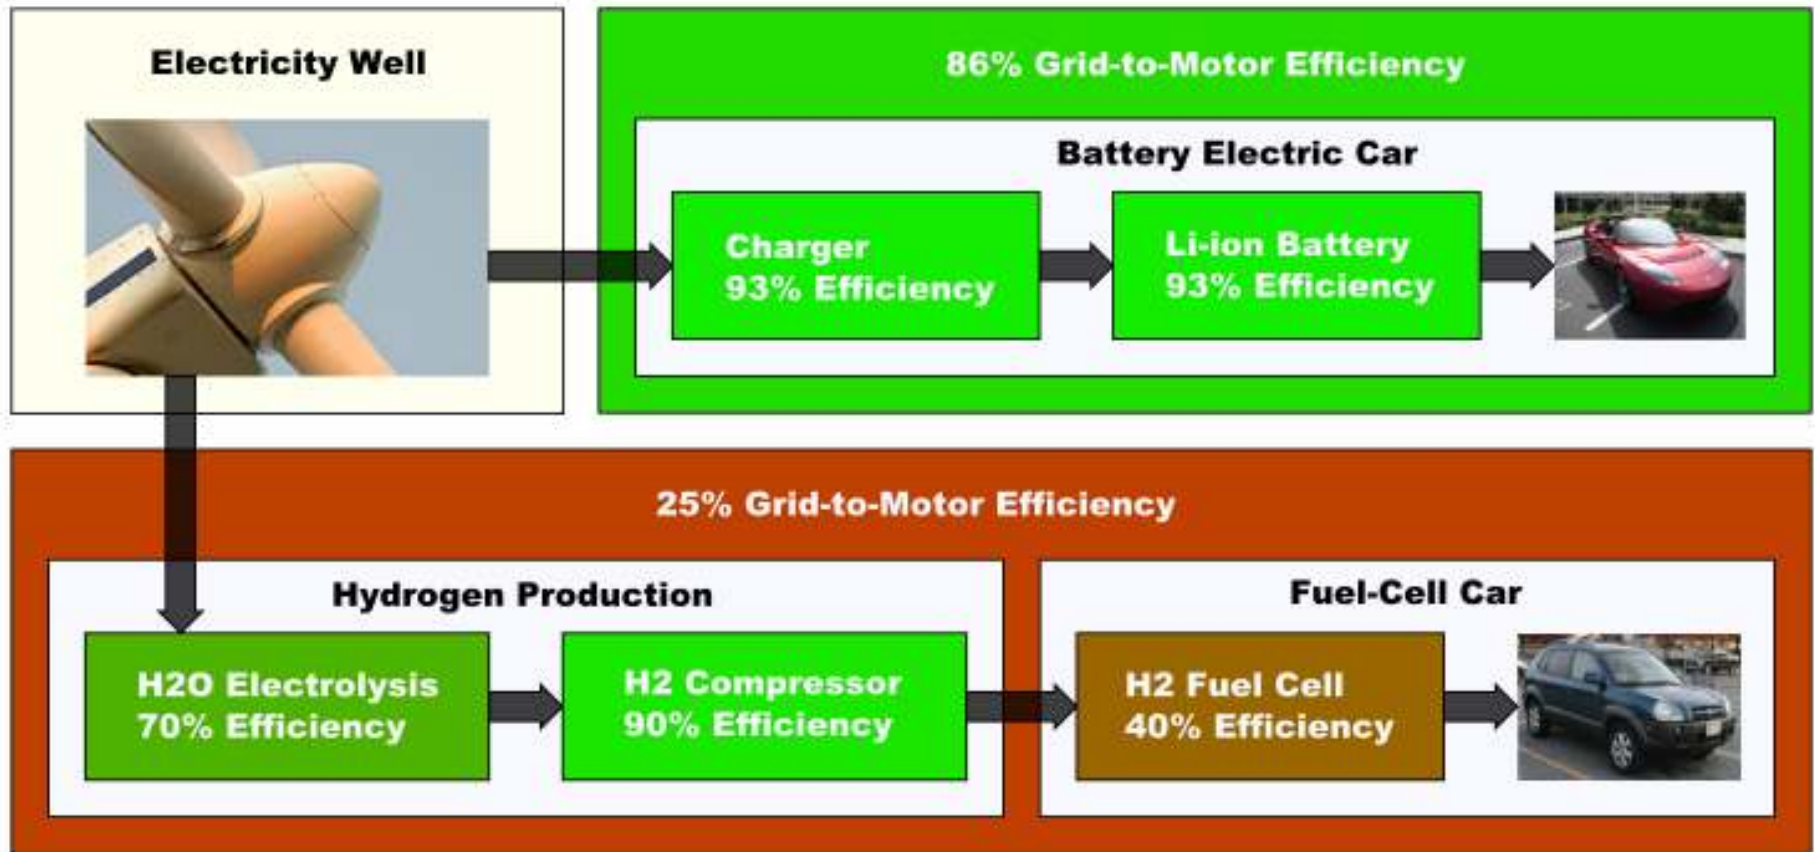

# Global Energy Systems Transitions, 1850-2150

Some see hydrogen as the future

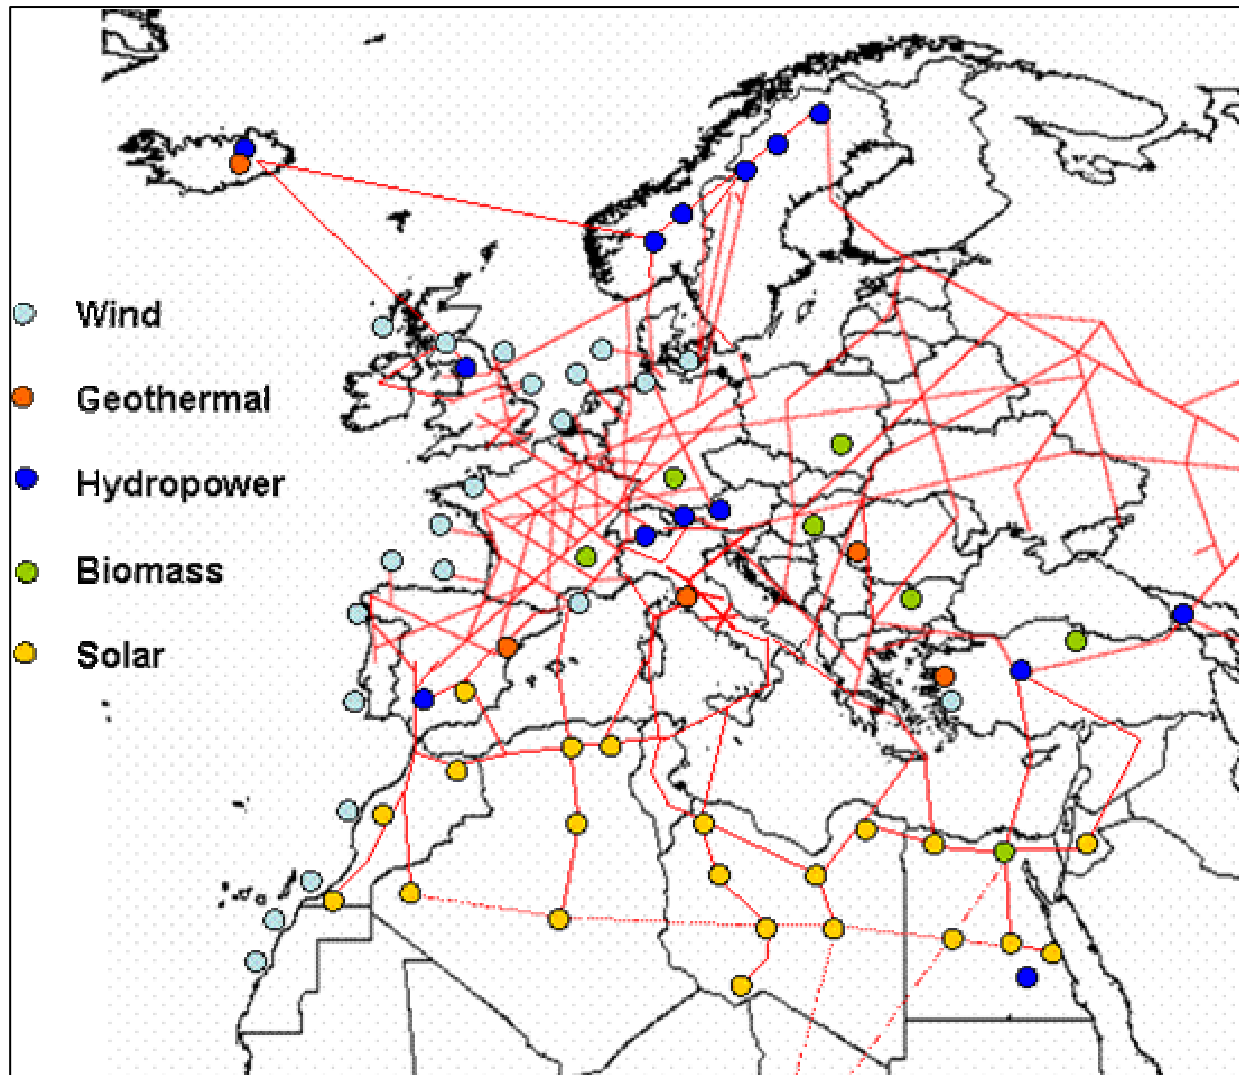

Source: LTI Research Group 1998

# Overall conversion efficiency is low...

..but hydrogen has the big advantage that it can be stored

**Electricity** is probably more likely  
High Voltage Direct Current **supergrids**-  
Energy losses 1-2%/1000km

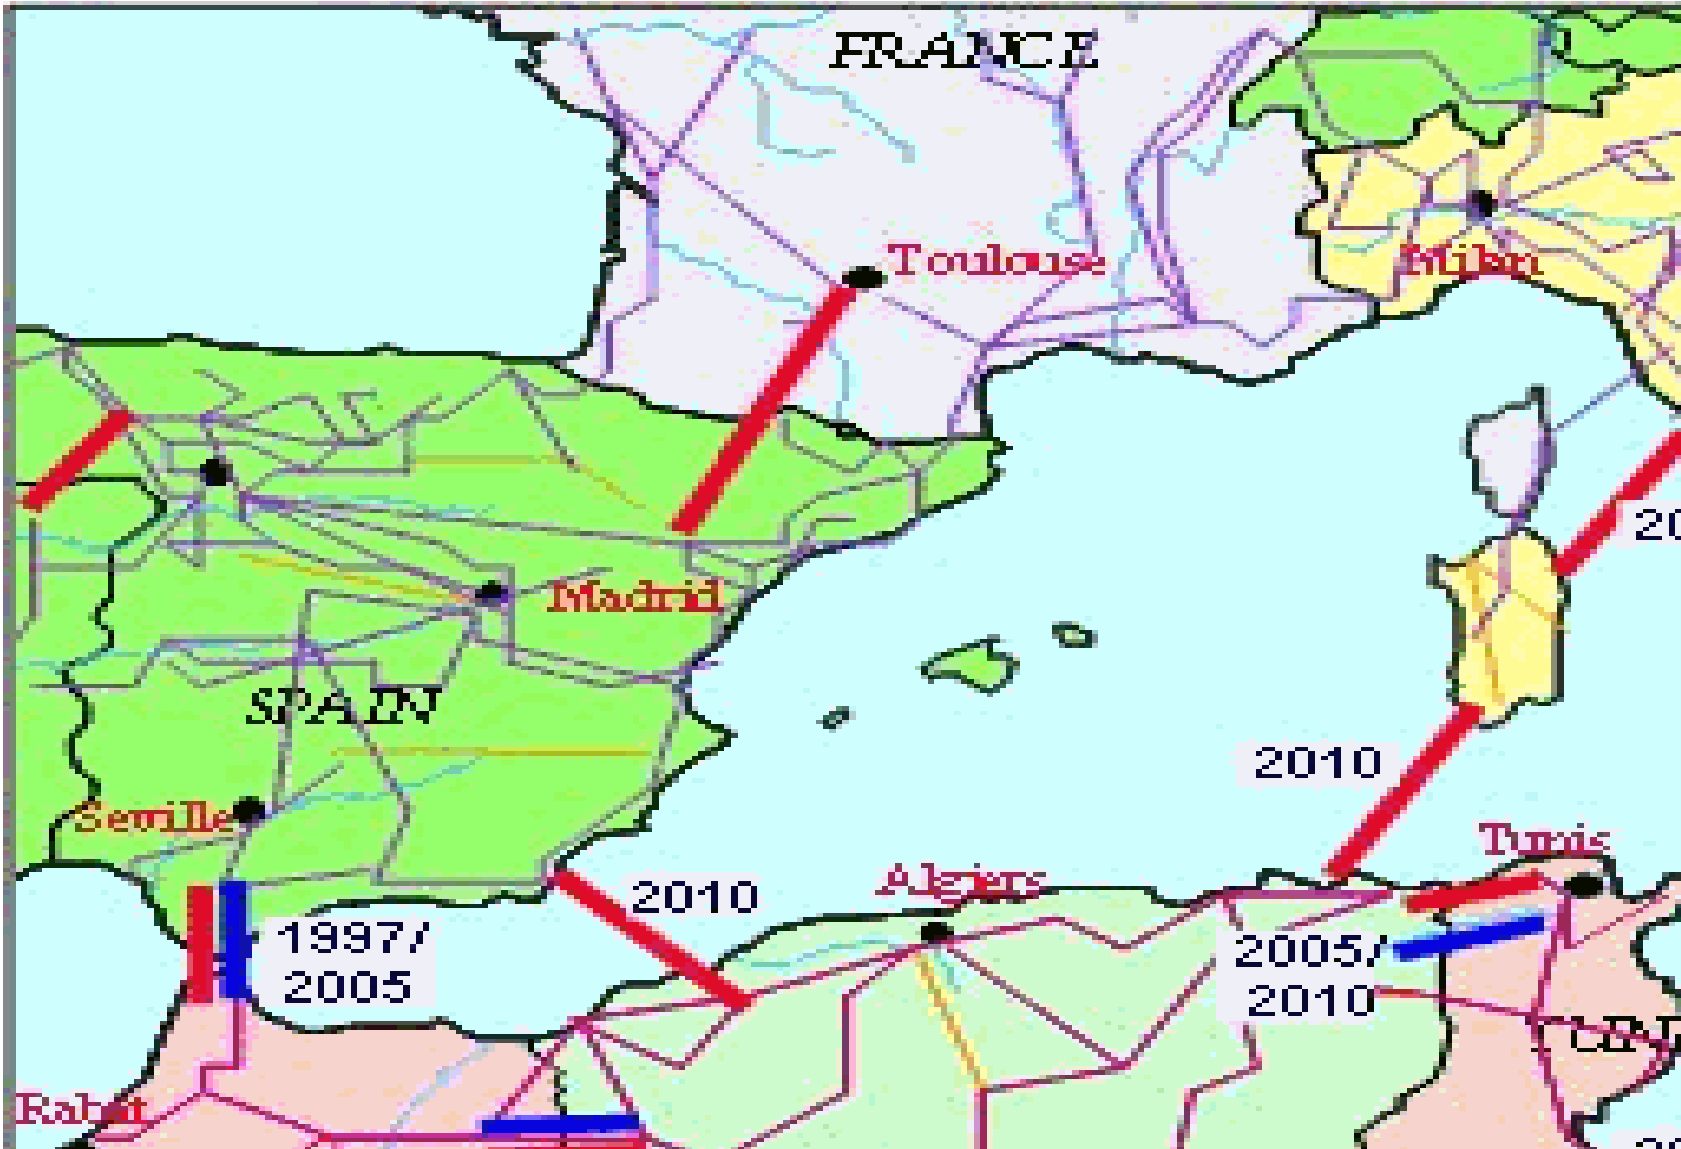

**EU-ME-NA grid network**  
with CSP solar in desert areas proving 15 % of energy via HVDC links and wind from the north sea also feeding in- plus hydro

# Concentrating Solar Power (CSP) Focused solar 'Power Tower'

**Can have molten salt heat storage for continuous power production overnight**

# HVDC grid links already planned for CSP from Africa

# Pros

# CSP/HVDC EU links

Why not make use of solar where it is most intense- with molten salt heat stores for overnight

Transmission losses low with HVDC links- 2% per 1000km

Builds positive trading links with poor areas

# Cons

Expensive and invasive- new grid links across the EU. Which might attract terrorists

Solar energy available on your roof- why collect it from far away?

Could be an exploitative relation with desert countries

Just swapping reliance on imported oil and gas for imported solar electricity- North could be held to ransom by the South!

Shouldn't we sort our own house out first? Won't this be used an excuse not to do so?

**Wind  
may  
be  
better**

Airtricity North Sea Supergird - linking in  
off-shore wind farms

10GW initial stage now planned

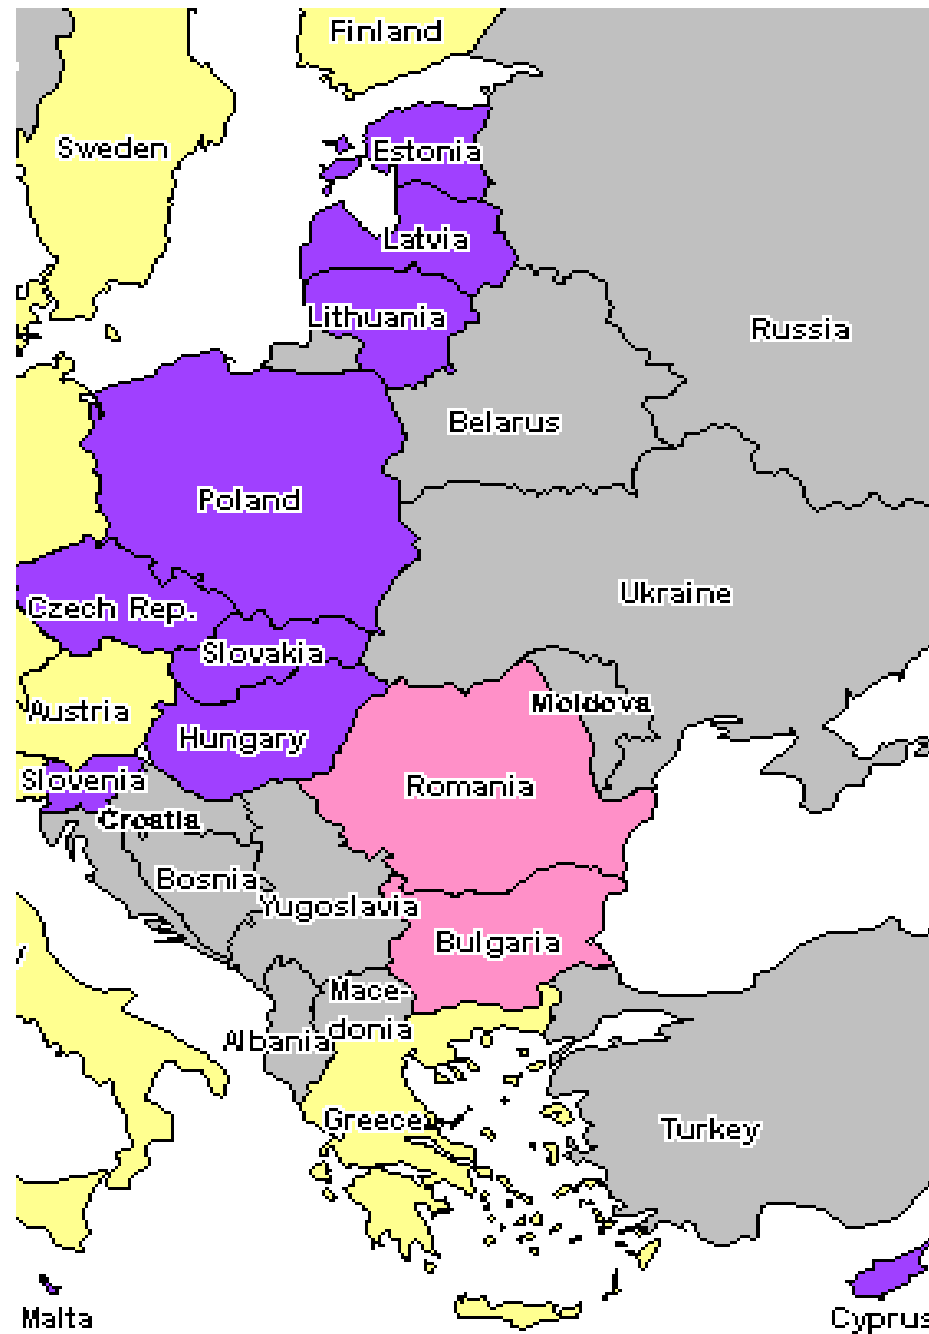

# Airtricity Supergrid

The EU is desperate to get Russia's gas. But so is China

# New Europe

## **New Europe: Renewable shares in emerging countries**

Share of RES as % of the consumption of primary energy (PES)

| <i>Country</i>                | PES (PJ) | RES (PJ) | % share |
|-------------------------------|----------|----------|---------|
| Bosnia and Herzegovina (2003) | 176.1    | 26.8     | 15.2    |
| Croatia (2004)                | 412.1    | 69       | 16.7    |
| Macedonia (2003)              | 123.3    | 13.2     | 10.7    |

*The renewable energy is mostly from large hydro plants and heat from traditional biomass.*

## EU Renewables Directive 2008

A new **Guarantees of Origin** trading system can be used to trade electricity and heat/cooling -in 1MWh units - **between EU countries**, for projects over 5MW.

Imported electricity, produced from renewable energy sources **outside** the Community, may also count towards EU Member States' targets, again using a system of guarantees of origin.

But limits may be imposed on how much can be imported- this is still being negotiated .

## JI and CDM Renewables & energy efficiency projects

EU Member States may also use **emission credits** generated by projects outside the EU, via either:

- \* The **Joint Implementation** (JI) mechanism - covering projects carried out in countries with an emissions reduction target under the Kyoto Protocol
- \* The **Clean Development Mechanism** (CDM) - for projects undertaken in developing countries.

Under EU 2008 ETS Directive, the credits from CDM projects can only make up 3% of 2005 emissions of any importing EU country.

# National and international issues

Should we in the UK/EU import power from overseas to set against of national renewables/emission targets?

It might help them earn money, but lets us off the hook.

Surely they should use it and reduce emissions, themselves.

But then it may be easier to generate green power in sunny/windy countries- and the planet doesn't care *where* the emissions come from

# World by Carbon Emissions

>> Size of a country  
equals emissions  
in million metric tons

WORLDWATCH  
INSTITUTE

© Worldwatch Institute, 2006

Original data: US Department of Energy

Map created by Mapping Worlds

# Technology Conclusions

Small can be beautiful, but so can large-  
we need both, in a supergrid network

It's a bit like IT: we moved from large centralised mainframes to decentral independent PCs, and then linked them up on the web.

# Emergent behaviour

The supergrid would allow local energy supply and demand variations to be better balanced across a wide area.

It could have a high degree of interactive links between users and suppliers - a 'smart grid' allowing generation and consumer demand to be better managed

As with the world wide web/internet, we can expect many new opportunities, capacities and functions to emerge, once the smart supergrid system is established

# European Commission Second Strategic Energy Review 2008

The EC's Green Paper on energy networks identifies six strategic initiatives as essential for the EU's energy security including a Baltic Interconnection Plan, a Mediterranean Energy Ring, adequate North-South gas and electricity interconnections with Central and South-East Europe, a North Sea Offshore Grid.

# Euro Grid

The European Commission's new Economic Recovery Plan (Feb. 2009) includes **100 million euros** (£93m) for a grid link between the Republic of Ireland and Wales to help renewables generators in Ireland access the UK energy market. And around **150 million euros** (£139m) for early work on a possible North Sea grid.

# Europa Grid

Norwegian owned Transmission company *Imera Power* has announced plans to build undersea electricity grids in both the Atlantic and the North Sea.

The Dublin-based company said its plan for a large grid of subsea AC and DC cables could become the "foundation" for a pan-European offshore electricity network.

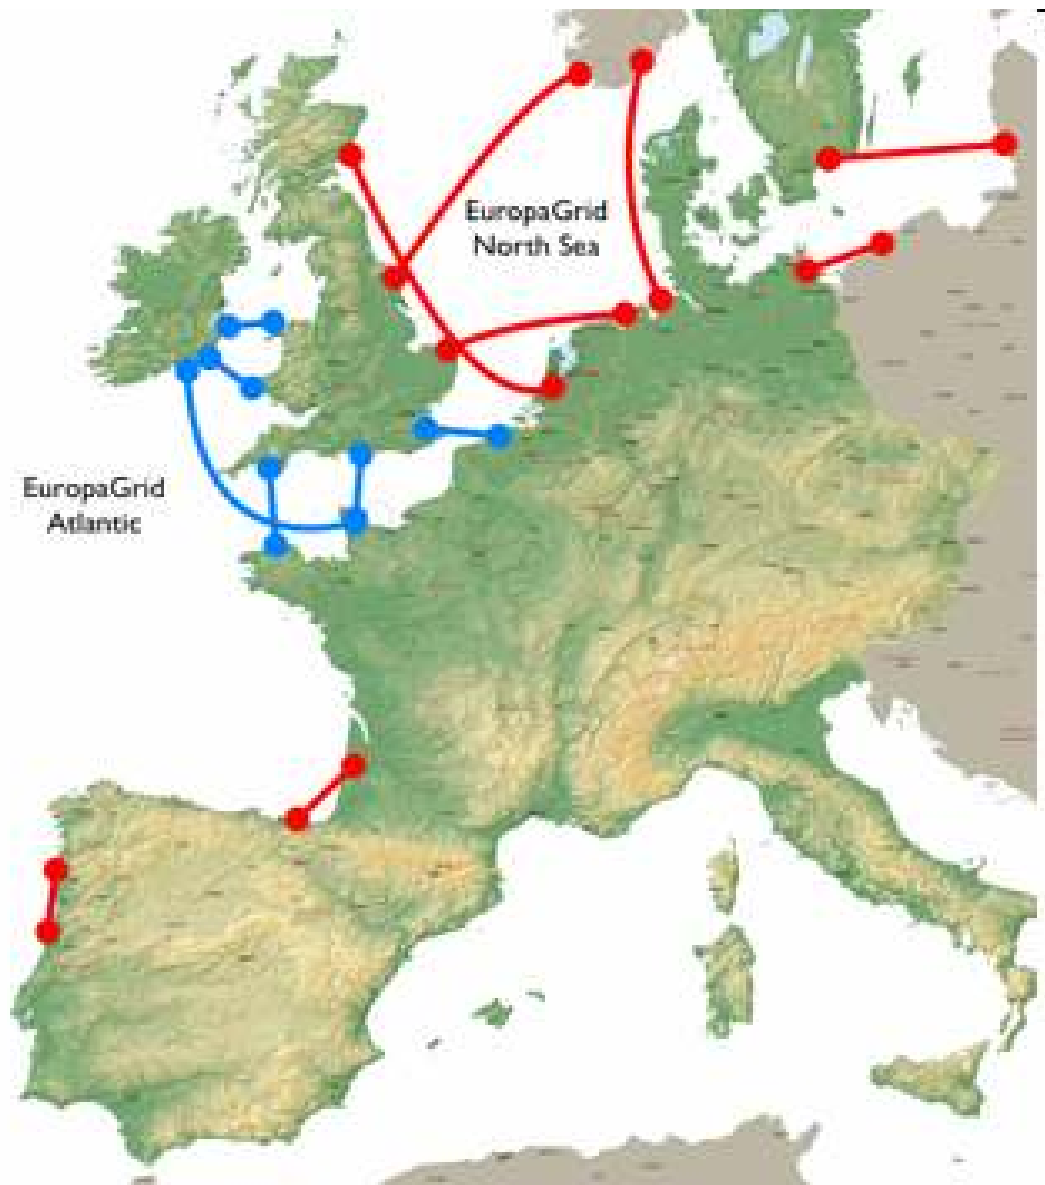

It is looking for 100m euros for the first stage.

Source: [NewEnergyFocus.com](http://NewEnergyFocus.com) 3/2/09

PHASE ONE

- Imera Projects Already Under Development
- Suitable for Offshore Windfarm Connection

The recently formed British company *Mainstream Renewables*, plans to create a Supernode, consisting of two interconnected offshore wind farms one British, one German, with a backup connection supplying Norwegian hydro, which it hopes to complete in 2015.

This demonstration project would then expand, and link to similar schemes elsewhere e.g in the Mediterranean.

New Scientist, 12 March 2009

# The US is going to do it too...

***"One of, I think, the most important infrastructure projects that we need is a whole new electricity grid. Because if we're going to be serious about renewable energy, I want to be able to get wind power from North Dakota to population centers, like Chicago. And we're going to have to have a smart grid if we want to use plug-in hybrids then we want to be able to have ordinary consumers sell back the electricity that's generated from those car batteries, back into the grid. That can create 5 million new jobs, just in new energy."***

**Barak Obama, Nov. 2008**

**Limiting climate change and avoiding energy security crises**

## Sustainable energy: key issues

- What scale?
- Which generation technologies?
- How to link up- supergrids?
- Is electricity the best vector?
- How to accelerate deployment?
- How to improve end-use efficiency?
- How much time have we got?
- What are the other options- adaptation?
