

Global Trade Network Simulator and Agent Based Modelling

15 June 2011

Dr Ugur Bilge

ugur@simworld.co.uk

Complexity Group
London School of Economics

Plan

- Agent Based Modelling, Simulations, Complexity
- IIASA Global Trade Network Simulator
- Demo
- Discussion

Background

- PhD in Computer Science from University College London 1993
- Research on “Intelligent Systems”: (ESPRIT II) 90-94
 - Neural Nets, Genetic Algorithms in Finance
- Consultancy for J. Sainsbury Plc Logistics Innovation Centre, 94-98
 - Data Mining, Forecasting and Optimisation
 - Agent Based Simulations, SimStore
- Set up SimWorld in 1998 -
- Development of SimFolio, in 2000, CommodityCast (now Qforma)
- Container World at Imperial College, 2001
- ICoSS Project at London School of Economics, 2001-2004
- Assistant Prof. at Akdeniz University, Faculty of Medicine, Dept of Biostatistics and Medical Informatics, 2003 -
- IIASA Global Trade Network Simulator, 2010
- REDD Game Project at LSE, 2011 -

Agent Based Modelling/Simulations

- Computational approach
- Autonomous agents
- Bottom-up modelling
- Simulate and observe
- Look for emergence and unexpected
- Educational
- Visualise and create virtual labs for discussion
- Generate insights, understand actors

Why Agent Based Models

- Social Events, Economic Depressions, Crises, Organisational Change
- Current approaches are not good enough
 - Linear Thinking
 - Top-down
 - Reductionist
- We need Complexity Thinking
 - Nonlinear
 - Bottom-up
 - Multi disciplinary

Complexity Thinking

- Inspired by Natural Science
 - Limits to our knowledge: Chaos Theory
 - Recent developments in Network Theory
 - Complex Systems, CAS, Complex Evolutionary Systems
- Natural Complex Systems:
 - Nonlinear, Positive Feedback, Adaptive and Evolving, Self Organising, Unpredictable, Uncertain, Sensitive to initial conditions, Path dependent, Far from equilibrium, Dissipative, Display Emergent, Spontaneous Phase Transitions
- Social Systems too?
Ten Principles of Complexity (Eve Mitleton-Kelly)
- We need new tools

Tools for Complex Social Systems?

- Linear Analytic tools; when non-linear, break into small parts, make linear
- Optimisation tools (minimise or maximise a function, linear or nonlinear)
- Statistical tools (assume linear, normal distributions)
- Game theory, behavioural economics
- All ignore feedback and adaptation, all are unsuitable to an extent!

ABS Strengths

- Decentralised thinking
- Emergence and Self-Organisation
- What-if scenarios from many perspectives
- Working in past (validation) and in future
- Statistical “prediction” for betting and speculation 😊
- ABM is ideal for social problems where
 - There are a number of autonomous, interacting agents where we are interested in understanding some aspects of social behaviour

ABS Obstacles

- Technology too new?
- Too expensive?
- Not enough data (prototype development can help data collection)
- Expecting
 - too much!
 - too little: “You get back what you put in”?
- Resistance to change
 - in thinking
 - in management

Agent Based Simulation versus Conventional Simulation (CS)

Conventional Simulation	Agent Based Simulation
top-down, and uses given environment	bottom-up, creates environment
assumes homogeneous populations with given stats, and few parameters	can use heterogeneous agents with many parameters
uses equations and formulas	can use adaptive agents
to produce results	to generate insight and explanation
react to results	learn and understand

ABS Development

- There are no off-the-shelf packages available, so
 1. Use ABM simulation environments such as NetLogo for demonstration
 2. Write your own
 3. Team up with others

Global Trade Network Simulator

IIASA

- International Institute for Applied Systems Analysis (IIASA)
Extreme Events in Human Systems Initiative –
Game Changers Project (Leena Ilmola, John Casti)
- Partners: Finland, Scotland, a number of research and business organisations
- Xevents Observatory and Simulation
 - Web Scanning
 - Global Trade Network Simulator

Game Changers (Ilmola, Casti)

Game Changers

ENDO - HUMAN SYSTEM

- Major loss of faith on political decision making
- Global order
- Integration of commercial and political power
- Public role in technology development
- Strength of the public sector
- IPR policies
- Growth decentralized
- Public role in financial market

TECHNOLOGY

- Zero energy
- Quantum computing
- Singularity almost there
- „Nan threats“

ENDO ECONOMY

- Growth decentralized/
- Development of virtual money/ exchange

EXO HUMAN SYSTEM

- Climate Change
- Ice Age
- Plant diseases
- Bio-system collapses
- Weather pattern changes
- Volcanic activity
- Pandemics
- Migration

Global Trade Network Simulator

Phase 1 – SimFinn – Agent Based Simulation of Finland's Economy

Coarse grain country agents,

Finland's economy in the global economic context,
interdependencies and economic crises contagion

Method: Network Simulation, and visualisation,

What if scenario analysis, Agent Based Simulation

- Data 1990 to 2009
 - GDP, Growth Rate, Exports, Imports, Population, Population Growth, revenues, expenditure, debt, sector data
- Projection into 2010 - 2030

GTNS Agents

22 Country Agents:

Euro: Finland, Sweden, Denmark, Belgium, Holland, Germany, France, Spain, Italy

Americas: USA, Mexico, Canada, Brazil

Asia: China, India, Japan, Indonesia

Others: UK, Norway, Russia, Turkey, South Africa

Data Source: CIA World Fact Book, World Bank, IMF

Initial Assumptions:

Economic growth is linked to trade network

Global events can change trade connectivity

Countries (as agents) can change connectivity

GTNS Objectives

- Capture trade network dynamics
- Ability to display extreme behaviour (using what if scenarios)
- Display emergent behaviour using simple rules at the agent (country) level, in this case newly forming cliques, alliances can be visualised
- Ability to do a combination of what if and agent rules
- Accurately calculating future GDP, exports, imports is not our objective, as this is done by other simulators such as IFs and CAMS

Resilience?

- Using breadth first search technique, establish sensitivity of each country to external shocks by all others in the network. We call this resilience of each agent.
- We can then establish the overall resilience of the network.
- Increased connectivity will cause the overall resilience to go down.

Impact of GDP shocks by others

Finland's Exposure to GDP shocks in 2009 (all values are %)

Future Projections

- Current assumptions use the mean values of the last N years values as the basis for the future GDP, import and export growth rates.
- As the system is driven by variable percentage growth rates, it displays exponential GDP growth in the period between 2010-2030
- Growth rates and connectivity can be changed by user defined What if scenarios and by ABM rules

Baseline Finland Growth Rate

Growth Rate and Trade Rules

- The simulator does not calculate GDP. It has a baseline GDP growth rate, and assumes this will continue unless global trade events occur, such as:
 - An increase/decrease in exports/imports, or
 - An increase/decrease in an export partner's GDP (in turn causes a change in the exports, and change in growth rate)
 - Currency rate changes also trigger changes in trade

So the change in the growth rate:

$$dGrowthRate = (dExports - dImports) / GDP$$

In summary: GTNS models the change in the Growth Rate as a result of changes in Exports and Imports

What if scenarios

Simulation Scope 1990 – 2030

- Current Assumptions Prevail: GDP, Population, Global Trade, Economic Blocks
- Possible Economic Crisis in one of the Agents (USA, EU, ...) its impact, spread (contagion, and cascades) on the global trade, and GDP growth
- Trade wars, new economic blocks (changing connectivity), add/delete, weaken/strengthen modify trade connections, change GDP growth profiles
- Test totally different network structures

Sample What if Scenario

Here is a user defined sample What if scenario:

In 2014 Russia's GDP will go down by 5%,

In 2016 USA imports from the rest of the world will go down by 10%

In 2020 USA exports to UK and Germany will go down by 10%

In 2022 Finland's export links are USA 30%, UK 30% and Russia 10%

In 2025 World wide economic crisis causes 20% drop in GDP in 3 consecutive years

In 2029 Finland's exports to USA go down by 1%, to UK go up by 1%, to France go up by 1%

2014	1	RUS	GDP	-5	
2016	1	USA	IMPORT	-10	World
2020	1	USA	EXPORT	-10	UK,GER
2022	1	FIN	LINK	100	USA,30,UK,30,RUS,10
2025	3	World	GDP	-20	
2029	1	FIN	CHANGE	100	USA,-1,UK,1,FRA,1

The simulator is able to run this what if scenario and show outcomes for all countries in terms of GDP, Growth Rate, Imports, Exports
Using the format above users can test their own scenarios

ABS Rules

- ABM functionality enables us to test agent level strategies such as a nation increasing trade with its nearest neighbour, (or the richest, or the poorest, or the fastest growing or the same bloc) nations
- Agents can also be initialised with randomly assigned rules, and check their performance every year, if they are not doing “well”, then switch to another rule

ABS Rule Structure

- A country agent or to all agents can use the following agent rules:
 - Rule 1. Increase trade with nearest N neighbours, and decrease trade with furthest N neighbours by X%
 - Rule 2. Increase trade with richest N agents, and decrease trade with poorest N agents by X%
 - Rule 3. Increase trade with poorest N agents, and decrease trade with richest N agents by X%
 - Rule 4. Increase trade with fastest growing N agents, and decrease trade with slowest growing N agents by X%
 - Rule 5. Increase trade with the same bloc N agents based on nearest neighbours, and decrease trade with other blocs N by X%

ABS and What if scenarios together

- ABS can be used in conjunction with user defined What if scenarios. This joint set up will provide insights into complexity of the global economy, and difficulties in policy making in a complex world

Multi Runs (Imagination?)

- Loop randomly selected N countries GDP all going down 10% at the same time.
- Randomly selecting different N countries every year between 2010 – 2030
- Every run produces different results, enables a search for extreme or unexpected outcomes
- Generate results
 - Difference from the default scenario
 - Display GDP, growth rates, etc
- Analyse results

Control panel for the simulation software. It includes several buttons and input fields:

- Buttons: ft: 2, ALoad, Save, x1exp.sav, Ge, Probe, Conf, Stat, Stats, Edit, Delete, Del, Add, us, Res, STOP, Speed: 500, 10, Set, Dtec, Hier, Grid, 4, 150, EPIRUN, All, statif, Fitness, Findif, FIN, GDP, Draw, MAP,

Phase 1 - Summary

- Scenario-driven tool to test user defined what if scenarios
- ABM functionality to test trading strategies for each country
- Complexity of global events and agent strategies
- To understand:
 - Economic Interdependencies
 - Contagion of crises
 - Success scenarios
- Cluster and group scenarios from a country's perspective, winning/losing scenarios

Areas of Contention

Global Economy

- trade and exchange rates
- holding of US Treasuries
- demand for energy

Geopolitical Issues and Global Security

- narrowing competitive power gap
- Taiwan
- future of North Korea
- competition for key resource regions

Ideological and Philosophical Issues

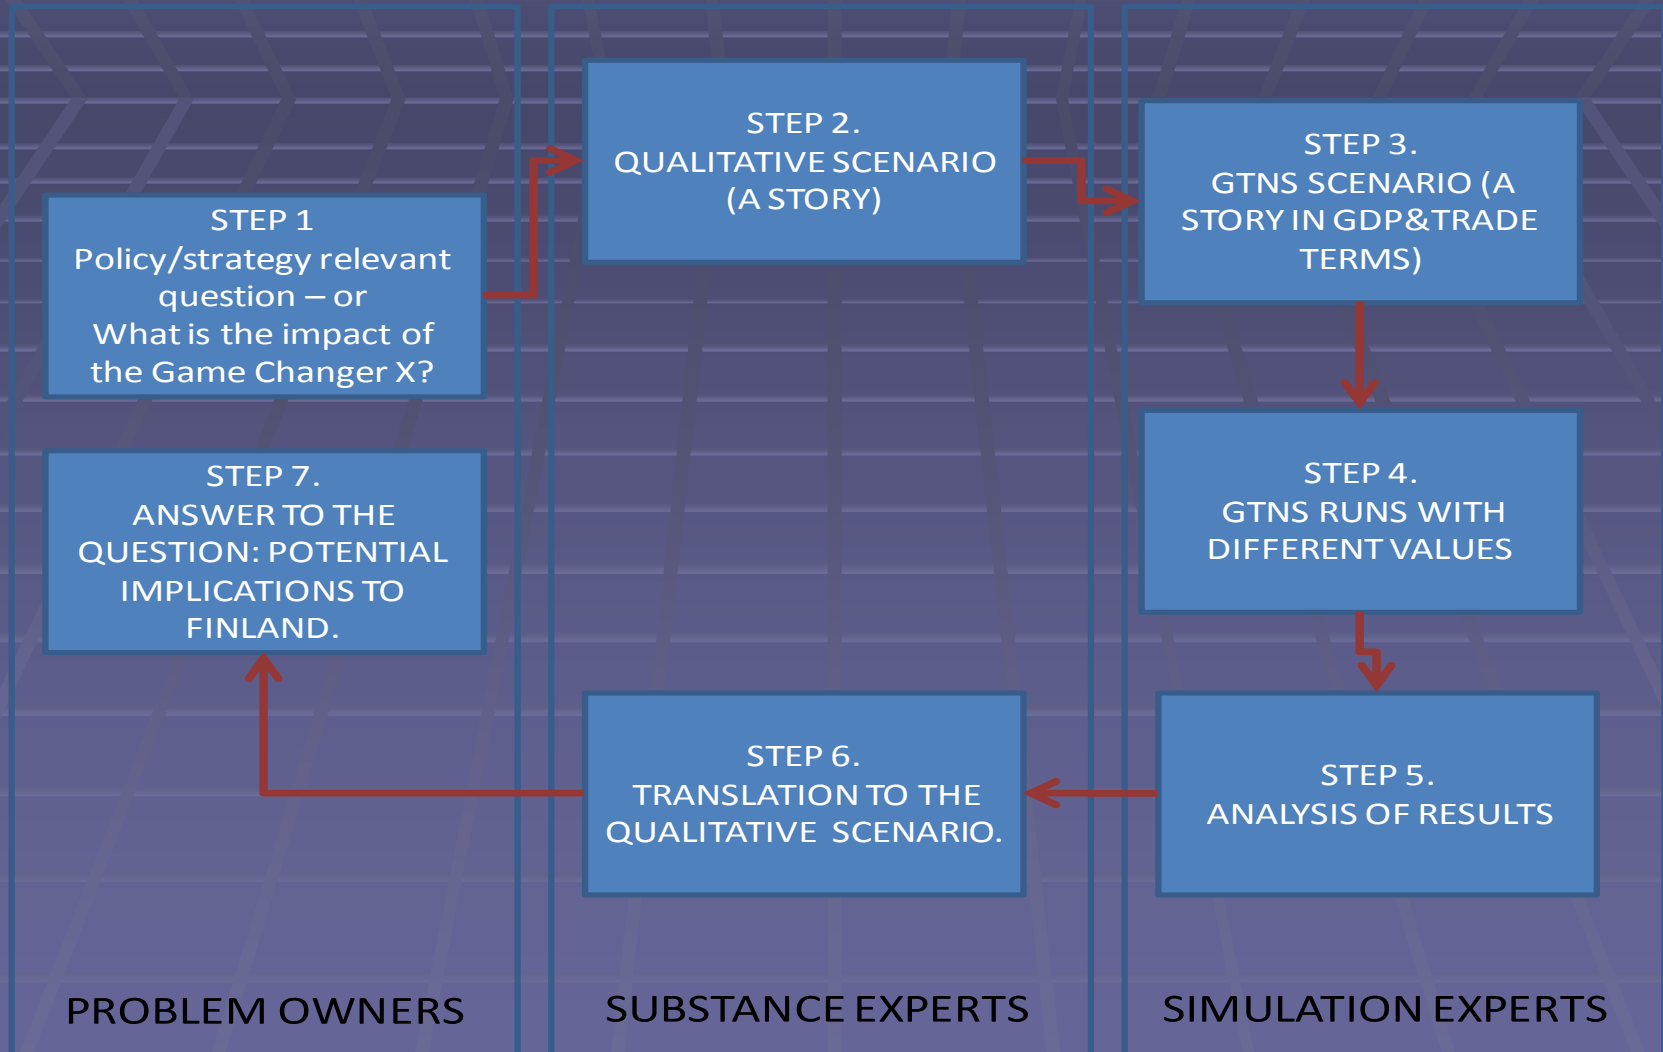

- democracy
- human rights
- religious freedom

Scenario Examples

The US is still the world's sole superpower, while China is rapidly emerging as one and is the only country that can realistically challenge the US for global dominance.

Meanwhile, their economic ties are now so important that China and the US have since 2007 been described as 'Chimerica' - two sides of a single economy that comprises a third of global GDP. Therefore, any deterioration in this relationship would be detrimental for global political, economic, and financial stability.

What if Scenario Process (Leena Ilmola)

China Scenarios

- 1. China challenges US dominance
 - 1.a China increasingly assertive in all domains (“hard” path)
 - *Wildest card: Military confrontation between China and US*
 - 1. b China assertive but more subtly (“soft” path)

Scenarios 1.a 1.b

- Scenario 1.a

Between 2010 and 2015 China increases trade in Asia, then 2015 to 2030 Asia turns back to USA

2010	5	CHI	EXPORT	10	IND

Sector Performance (European Scenario causes some sectors outperforming while others underperforming)

4 New Scenarios

- We developed 4 new scenarios to highlight what kind of questions we can ask with GTNS to give us insights about Finland's economy and its sector performance by 2030
 - China Germany Scenario
 - China's trade is weaker and Germany is stronger
 - BRIC Scenario
 - BRIC countries are strong but Europe is weaker
 - China Revaluates Scenario
 - China revaluates Yuan
 - Euro Scenario
 - What if Euro disintegrates

China Germany Scenario

Between 2015 and 2020

China's trade with the rest of the world goes down by 10% a year.

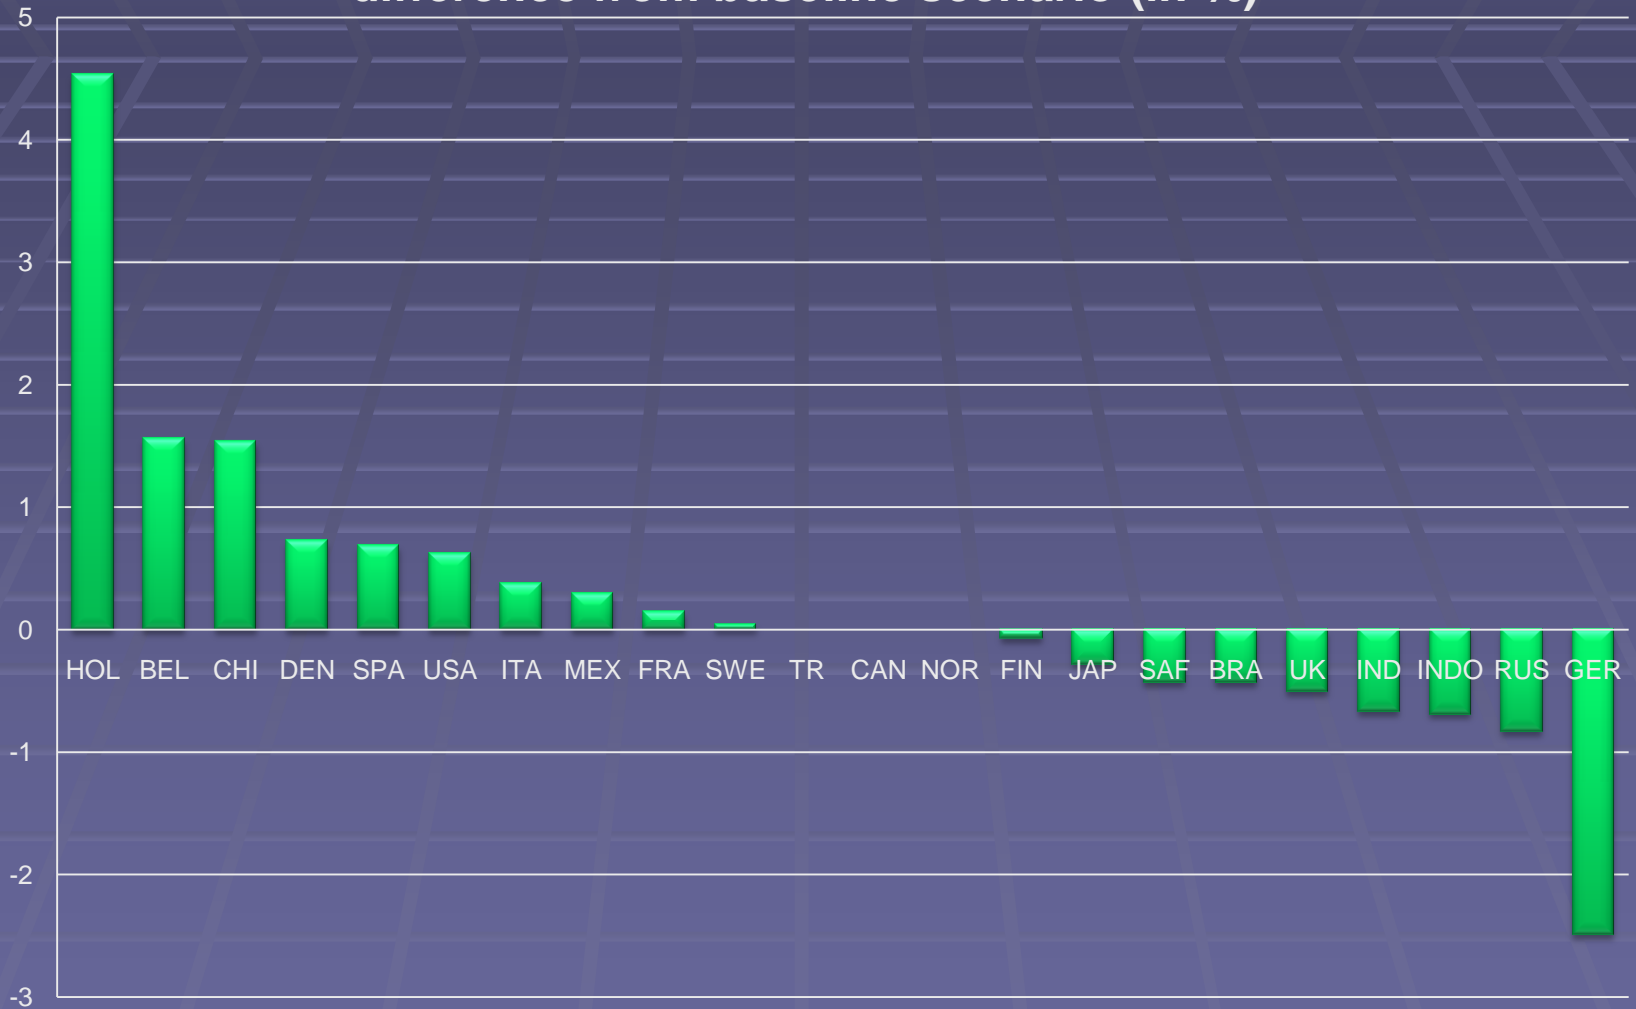

During this period Germany increases its imports from the Euro zone by 2% a year and increases exports to USA, Japan and UK by 2% a year.

This scenario has a number of unexpected consequences for Finland, While Finland's growth is affected very little, some sectors do rather well, others do badly.

Growth Rates (%)

#date	FIN	GER	CHI
2010	1.687248	0.505070	10.769666
2011	1.687248	0.505070	10.769666
2012	1.687248	0.505070	10.769666

Future Work

- Include in the Global Trade World Simulator:
 - Investment, Consumption and Government Spending
 - Revenues, Expenditure, Savings, Debt, Deficit
- Household Simulation, using a region of Finland developing an Agent Based Simulation
 - Employment, Savings, Education, Age, Health, Confidence, and Mood
- Link Global Trade World Simulator and Household ABS for policy making
